**Term:** Argument  

**Quote:** A sign is also intended to determine, in a mind or elsewhere, a sign of the same object; and this *interpretant* of the sign may be the very sign itself; but as a general rule it will be different. It is a perfection in a sign separately to signify its intended interpretant. If it does this, it becomes and *argumention* or *argument.* (Some pedants insist on the former word; but the very best usage supports the latter.)

**References:** MS [R] 9:1-2

**Date of Quote:** 1904
